

# Systems & Services

## Integration

Axelarissuite delivers a complete integration framework

### Introduction

Axelarissuite delivers a complete integration framework that comprises a set of pre-packaged toolkits and APIs. Axelariss integration solution enables integration with cloud services and existing enterprise systems in order to automate and integrate the capabilities within business workflows.

### Solution Packages

Axelariss Systems & Services Integration is an enterprise-class integration platform as a service (iPaaS). Axelariss suite securely connects SaaS and on-premise applications at cloud. With no hardware to maintain or software to upgrade, Axelariss secure multi-tenant platform flexibly deploys the integration of on-premise applications in hybrid architecture. Axelariss solution guarantees the freedom of cloud integration.

Axelariss Systems & Services Integration is available in three editions:

**Standard** Get started with standards connection to major transports, protocols and business applications.

**Professional** Deliver Data to customer in real-time and stay in sync with API, and secure on premise connectivity without firewall policies changes or proxy servers.

**Enterprise** Build a complete and mature Systems & Services Integration solution. Offer quick and consistent on-demand integration of multi-tier applications. Deliver availability SLAs for business critical applications and maintain performance SLAs with application monitoring.

## Solution DATASHEET

	Standard Edition	Professional Edition	Enterprise Edition
Standard Connections	Basic	Professional	Enterprise
Premium Connections	No	Professional	Enterprise
Real-Time Integration	No	No	Enterprise
Secure Data Gateway	No	No	Enterprise
Support	No	Professional	Enterprise
Enterprise SLA	No	Professional	Enterprise
Unlimited users	No	Professional	Enterprise
Alerting	Basic	Professional	Enterprise

### Component Overview

The Integration framework builds upon several Axelariss Usage Models and component: Infrastructure, Fulfillment, Revenue Management and Customer Service Management.

The System & Service Integration Packages are related with the components that are builds upon.

### API

Axelar Systems & Services Integration enables a new kind of ecosystem by delivering API federation and simplifying development of cross-enterprise APIs.

Partners will be able to build new apps on top of the API platform. Partners can start with simple apps - e.g., searching product database - and expand later.

Developers provide the leverage to attach an ever-fragmenting world of customer segments and niches. Our API strategy doesn't focus on content only, but on driving developer adoption also – making it as easy as possible for developers to use our content.

Every customer interface from the beginning to the end of the experience chain is accessible via an API.

### Key Features

- **Product search API:** Consumers can search for products on our site. They are able to do this from any app.
- **Merchandising API:** Savvy customers love to see what other people like to purchase. Hence, our partners can pull the information out of our API, so they can feature them on other sites or applications to bring traffic to our site.
- **Promotions API:** We publish our discounts and promotions via an API.
- **Customer API:** It allows our brand, through a consistent customer experience, to be centrally displayed no matter what applications, websites, or devices they access it from.
- **Content API:** Customers love to share with their friends and the general public their products experiences.
- **Order API:** We help our partners become more efficient by downloading our web orders around the clock for fulfillment by them.

## Solution DATASHEET

### Benefits

- Efficiency
- Wider Reach
- Leverage Government Assets
- Automation
- Apps
- Partnerships
- Integration
- Personalization
- Future-Ready

### Professional Services

#### Implementation services

Axelar Implementation Services is your trusted partner for planning, deploying, integrating and optimizing your Axelar Cloud solution.

## Cloud Service Bridge

With the focus on converged clouds, it is important for enterprise IT organizations to connect to the growing array of public cloud services in the simplest way possible—without sacrificing security. At the same time, in order to gain the benefits of a converged cloud, there must be some transparency between public and private clouds.

Axelar Systems & Services Integration Suite enables the enterprise to build converged cloud solutions by connecting their data centers to external clouds using our Cloud Service Bridge.

Cloud Service Bridge connects enterprise data centers to external or hosted cloud services, making the public cloud a secure extension of the enterprise network.

## Key Features

- **Federated Single Sign-On:** Standards-based authentication (SAML) for cloud service applications, mobile applications, and personal property (i.e., cars).
- **Open Platform:** Cloud Service Bridge SPE provides unparalleled flexibility and simple APIs, and supports open standards for building a personalized solution.
- **Identity Synchronization:** Real-time, automated user account synchronization between enterprise and cloud services.
- **Mobile and Cloud Service-Ready:** Provides a secure and transparent connection between cloud service, mobile devices, and enterprise using.
- **Stand-alone Bridge:** Stand-alone appliance that integrates with any infrastructure.
- **Simple Setup and Configuration:** Designed for easy, step-by-step configuration to reduce complexity and deployment costs.
- **Flexible Architecture:** customize Cloud Service Bridge to support any enterprise identity source or target cloud app.

## Solution DATASHEET

## Benefits

- Meet compliance reporting requirements
- Increase SaaS / mobile service adoption
- Improve SaaS service utilization
- Improve service quality
- Immediate return on investment

### 3rd Parties Accounting & Billing Platforms

3rd Parties Accounting & Billing Platforms provide instant API connectivity to some of the most popular sales applications and services. With a library of pre-built sales application integration solution, customer can rapidly connect CRM, accounting, billing, marketing, other sales applications and even legacy systems. Unlike other integration options, Any point connectors are built and managed on our platform, allowing you to deploy integrations rapidly, either on premise or in the cloud for all your sales application integration needs.

#### Key Features

- **Anypoint Connectors:** Connectors function like endpoints. They send and receive data over a transport. However, while endpoints are generic for a widely-used protocol (such as JDBC, FTP, HTTP, POP3, etc) each connector is built to optimize the connection with a specific third-party API.
- **API instant connectivity:** With full access to the third party platform through the API, businesses can perform operations such as managing subscriptions from a web storefront, retrieving user information, and synchronizing catalogs with ERP systems. Moreover, with instant API connectivity with the API, users can easily configure integration with popular third party applications and systems.

## Solution DATASHEET

#### Benefits

- Create connectivity quickly either on-premise or in the cloud
- Overcome the challenge of integrating SaaS
- Build integrations quickly and efficiently
- Connect to other SaaS and on-premise applications

#### Professional Services

##### Support

Axelar solution guarantees a superior service delivery to the customer and a fundamental solution for IT service management organizations.

## Conclusion

When everything is a service, APIs become the building blocks and leverage points of your cloud application. Deconstructing our application into separate web service APIs enables easy re-use and publishing of your application's capabilities for integration into other cloud apps, while also enabling you to invest in and scale appropriately each individual service. Additionally, well-designed APIs shield your application from underlying technology implementations (something we strongly recommend and address further below) as well as vendor-specific implementations. World-class cloud application architecture is constructed from API primitives which address the simplest and most direct use-cases in order to enable flexible assembly into solutions. This should inform not only your cloud application architecture but also your evaluation of vendor solutions. Encapsulating technologies you create or purchase behind RESTful APIs enables an
